

SIO203C/MAE294C: Perturbation theory and asymptotics

W.R. Young ¹

March 2014

¹Scripps Institution of Oceanography, University of California at San Diego, La Jolla, CA 92093-0230, USA.

Contents

1	Algebraic perturbation theory	4
1.1	An introductory example	4
1.2	Singular perturbation of polynomial equations	6
1.3	Double roots	8
1.4	An example with logarithms	9
1.5	Convergence	11
1.6	Problems	11
2	What is asymptotic?	14
2.1	Convergence and asymptoticity	14
2.2	The definition of asymptoticity	17
2.3	The Landau symbols	18
2.4	Stokes lines	20
2.5	Problems	20
3	Why integrals?	22
3.1	First-order linear differential equations	22
3.2	Second-order linear differential equations	22
3.3	Recursion relations: the example $n!$	23
3.4	Special functions defined by integrals	24
3.5	Elementary methods for evaluating integrals	25
3.6	Complexification	26
3.7	Problems	29
4	Integration by parts (IP)	33
4.1	Dawson's integral	33
4.2	Fourier Integrals	34
4.3	The Taylor series, with remainder	39
4.4	Large- s behaviour of Laplace transforms	41
4.5	Watson's Lemma	42
4.6	Problems	44
5	Laplace's method	46
5.1	An example	47
5.2	Another Laplacian example	48
5.3	Laplace's method with moving maximum	49
5.4	Uniform approximations	51
5.5	Problems	52

6	Autonomous differential equations	57
6.1	The phase line	57
6.2	The phase plane	60
6.3	Nonlinear oscillators	63
6.4	Problems	63
7	Perturbation of ordinary differential equations	67
7.1	The projectile problem	67
7.2	Problems	71
8	Some oscillator problems	73
8.1	The harmonic oscillator	73
8.2	Resonance	73
8.3	An initial value problem for an unforced oscillator, $f = 0$	74
8.4	Introduction to multiple time scale theory	77
8.5	Problems	78
9	Multiple scale theory	81
9.1	The Duffing Oscillator	81
9.2	The quadratic oscillator	83
9.3	Symmetry arguments	85
9.4	Rapidly fluctuating variables	85
9.5	The resonantly forced Duffing oscillator	86
9.6	Mathieu's equation and parametric instability	90
9.7	Problems	90
10	Regular perturbation of partial differential equations	92
10.1	Problems	92
11	Eigenvalue problems	93
11.1	Regular Sturm-Liouville problems	93
11.2	Trouble with BVPs	95
11.3	The eigenfunction expansion method	96
11.4	Eigenvalue perturbations	98
11.5	The vibrating string	100
11.6	Problems	102
12	Stationary phase	106
12.1	The Airy function	106
12.2	Group velocity	107
12.3	An example: the Klein-Gordon equation	108
12.4	Problems	112
13	Constant-phase (a.k.a. steepest-descent) contours	114
13.1	Asymptotic evaluation of an integral using a constant-phase contour	115
13.2	Problems	116

14 The saddle-point method	117
14.1 The Airy function as $x \rightarrow \infty$	117
14.2 The Laplace transform of a rapidly oscillatory function	119
14.3 Inversion of a Laplace transform	123
15 Evaluating integrals by matching	124
15.1 Singularity subtraction	124
15.2 Local and global contributions	125
15.3 An electrostatic problem — H section 3.5	128
15.4 Problems	131
16 Boundary Layers	133
16.1 Stommel’s example	133
16.2 Leading-order boundary layer solution of the sand-pile model	135
16.3 Stommel’s problem with variable speed	137
16.4 Other BVPs with boundary layers	140
16.5 Problems	143
17 More boundary layer theory	145
17.1 Stommel’s problem at infinite order	145
17.2 Higher-order corrections	147
17.3 Problems	148
18 More examples of boundary layers	151
18.1 Boundary layers in time: the initial layer	151
18.2 A fourth-order differential equation	152
18.3 Problems	154
19 WKB	156
19.1 Applications of the WKB approximation	156
19.2 Problems	160
